

Revised Title: Internet Use and Unmet Need for Family Planning Among Currently Pregnant Women in Bangladesh: Evidence from a Nationally Representative Survey.

20th June 2026

There is a major disconnect between what authors **Response Letter** says they did and what is actually written in their **Manuscript Text**. Author told the reviewers he made several changes, but those changes are missing from the text.

Author must fix these major inconsistencies immediately to avoid frustrating the reviewers:

- You told Reviewer 1 that you removed the C-statistic (AUC). However, Section 3.3 still discusses the ROC analysis, and **Figure 3** is still a standalone ROC curve. Fix: Delete the ROC paragraph in 3.3 and completely remove Figure 3.
- You told Reviewer 1 you deleted the non-essential global comparisons (like Sub-Saharan Africa). They are still in the second paragraph of your Introduction. Fix: Delete those sentences.
- You told the reviewer you removed temporal words like "today" to keep the timeline clear. The Introduction still says: "...to over 60% today [8]". Fix: Change "today" to "as of 2022".
- You told Reviewer 2 you would clarify your study population. Yet, the very first sentence of your Discussion still says you studied "*ever-married women*" instead of "*currently pregnant women*". Fix: Change this immediately to prevent denominator confusion.
- **The Sample Size Mystery:** Your text says your final sample size is **4,370**, but the flowchart in Figure 1 ends at **4,448**. Fix: Make sure the text matches the final box of your flowchart.
- **Table 1 Discrepancy:** In Table 1, the "No" and "Yes" rows for internet use add up to over 13,000 women, which is way larger than your actual study sample of 4,370. It looks like uncleaned data from the broader BDHS dataset accidentally stayed in those cells. Fix: Double-check and update those numbers.

What is Working Well

- **Strong Foundational Science:** The paper addresses a highly important public health paradox (why internet access might correlate with higher unmet family planning needs among pregnant women).
- **Great Technical Additions:** Using a DAG for confounder selection and providing your reproducibility code in Supplementary Table S1 are excellent steps for data transparency.

My Comment & Advice

Reviewer Strategy Comment: Right now, the science in the paper is solid, but the execution of authors revisions is high-risk. Reviewers get incredibly annoyed when an author's response letter says *"We have removed this and clarified the text"* but a quick search of the manuscript proves otherwise. It makes it look like that authors are trying to bypass their critiques without doing the work.

Immediate next step: Do a hard Ctrl + F (Find) in your manuscript file for keywords like "ROC", "Africa", "today", and "ever-married". Force the manuscript text to exactly match the promises you made in your response letter. Once those text edits match your claims, this paper has a very high chance of acceptance.
